MINUTES OF THE HOUSE & SENATE COMMITTEE ON EDUCATION.

The meeting was called to order by Chairperson Barbara Lawrence at 12:00 p.m. on February 10, 1997 in

Room 313-S of the Capitol.

All members were present.

Committee staff present: Ben Barrett, Legislative Research Department

Avis Swartzman, Revisor of Statutes Cindy Wulfkuhle, Committee Secretary

Conferees appearing before the committee:

Bob Sampieri, Coopers & Lybrand Larry Maloney, United States Chamber of Commerce

Others attending: See attached list

Bob Sampieri, Coopers & Lybrand & Larry Maloney, United States Chamber of Commerce, gave a presentation to the Senate & House Education Committees on the Finance Analysis Model™ (Attachment 1). Public schools are under pressure to find more funds in the face of cutbacks while protecting the educational process in the classroom from them. Coopers & Lybrand started researching how much money actually reached students in the classroom. They found that most educational accounting systems use the district, not the school and classroom as their reporting unit.

In 1994 they developed the Finance Analysis ModelTM (FAM) for K-12 grades. FAM is software that permits districts to build a relational data base from whatever accounting system is already in place to analyze expenditures and to report all costs as follows: by each school site, central office and non-allocated; by function, whether for classroom instruction, instructional support, operations, or other commitments; and by programs, including special education, general education, bilingual, Title 1 & 2, and other local programs. It would provide the community with a secure level of understanding as to how the money is spent. They stressed that FAM is a management information tool not a replacement for accounting.

The analysis program was designed to analyze 100% of a school district's general ledger. The site-based philosophy of accounting shows where education dollars are really going, whether it be a comparison of instruction vs. support services or central administration vs. individual schools. It allows communities to view how schools within the same district compare and determine whether some schools invest resources in teaching and learning more efficiently than others.

Currently, South Carolina, Rhode Island & Hawaii have statewide programs and, as of yesterday, Georgia's House of Representative approved a statewide program.

The committee meeting adjourned at 1:00 p.m.

Tracking Expenditures To the Classroom

By Sheree T. Speakman, Dr. Bruce S. Cooper, Hunt D. Holsomback, Jay F. May, Robert A. Sampieri and Larry Maloney

INANCIAL MANAGers in America's public schools are under pressure as never before: to find more funds in the face of cutbacks; to provide essential information quickly, accurately and easily; to enable decision-makers to handle unexpected crises; to protect the educational process in the classroom (i.e., teaching and learning) from these cutbacks; to examine the so-called "administrative bloat," so that spending is cut without crippling the ability of districts to manage their affairs; and ultimately, to provide "actionable information" for a wide range of stakeholders (e.g., administrators, teachers, parents, community and business leaders), all of whom want some voice in determining school priorities, programs, and outcomes.

An Historical Overview

Until recently, however, the systems of educational budgeting and accounting have been organized for regulatory reporting, making rapid and understandable public communications more difficult. Moreover, the unit of analysis has not been the school itself but the district. Financial managers have typi-

cally computed district averages, district per pupil costs and district spending patterns rather than breaking out costs for individual schools. In public education, accounting has been designed to reassure the funding agencies that dollars are spent legally and appropriately, rather than to help school-site personnel make better decisions. And data have been shared upward to the board, the city, county, state and/or federal agencies, and, less frequently, downward to schools, principals, teachers, parents and the community.

Attempts by the federal government to standardize school accounting voluntarily, through Handbook II (Revised, National Center for Education Statistics, Fowler, 1990) and requirements to use GAAP have not been adopted in many of the 50 states, requiring that national databases be created using elaborate cross-walks and other adjustments. Thus, efforts to generate national and even state education spending baselines and benchmarks have been seriously hindered by the differences among many district and state accounting and financial management systems. Observing national trends calling for more information on schools

and comparable data on schools creates the need for a new education electronic financial management system, one that uses standard categories; focuses attention on classrooms and resource support for the teaching and learning process; and provides mission-directed, actionable information for significant school-site reform.

Building the Finance Analysis Model

This research on education spending started five years ago with a question: How much money actually reaches students in the classroom for instruction? Simple enough, but most education accounting systems used the district, not the school and classroom, as their reporting unit; and equity was measured between districts, not among schools and classrooms. Thus, very little was known about school-site costs and efficiency.

A first attempt to trace money to the student occurred in New York City in 1989 and involved Bruce Cooper and Professor Robert Sarrel, then a Fordham University graduate student and head of NYC high school allocations. Under the auspices of the U.S. Chamber of Commerce's

House Education 20 10, 1997 actachment Center for Workforce Preparation, Cooper and Sarrel developed a model for schools alone, which was later expanded to all expenditures at central office and schools. With a grant from the Lilly Endowment, the finances of an additional eight school districts across the nation were analyzed, accounting for money at both school and district levels.

In 1994, the accounting firm of Coopers & Lybrand LLP, under the leadership of partner Sheree T. Speakman, joined its K-12 Education Team's school finance research with that conducted by the Center for Workforce Preparation and began development of a PC-based, interactive software package to crosswalk and allocate district costs to schools and direct classroom instruction (see Cooper and Sarrel, 1989; Griscom, Cooper, and Cohen, 1991; Cooper et al., 1994; Odden, 1993; Speakman et al., 1995; Hanushek, 1994).

The efforts of these various researchers ultimately led to the Finance Analysis Model (FAM or Model). FAM is software that permits districts to build a relational data base from whatever accounting system is already in use to analyze expenditures and to report all costs as follows: 1) By each school site, central office and non-allocated; 2) by function, whether for classroom instruction, instructional support, operations, other commitments or leadership; and 3) by program, including special education, general education, bilingual, Title 1 and 2, and other local programs. Already, FAM has been tested in Arkansas, Georgia, Nebraska, New York, Oregon, Pennsylvania, South Carolina, Texas, Utah and Wisconsin.

The new model is thus instructionally focused on function, program and site-level (school specific) spending, and uses the following methodology:

Specification—Using all

■ Specification—Using all funds, the Model builds a set of

FIGURE 1

Other Schools	Chapters 1 & 2

common definitions, procedures, formulas, and student populations, incorporating 100 percent of school-year expenditures. This stage is critical to ensure consistency and comparability among school-sites and districts;

- Inputting—The software program uses a file of the district's general ledger, taken at a specific point in time, as the input necessary to create the data used by the Model. The coding structure of the general ledger is used by the Model to ensure that expenditures are appropriately identified and categorized;
- Mapping—FAM cross-walks the district's general ledger by mapping five functions: instruction, instructional support, operations, other commitments and leadership, at each and every school location. The mapping process is first used for items that have a clear functional and locational indicator in the general ledger. Remaining expenditure line items without direct school-site indicators are attributed to their appropriate site and function using the allocations methodologies built into the Model;

Allocations—Attributing centrally budgeted and controlled costs to their appropriate locations, FAM can allocate such traditional expenses as pupil transportation, food services, school operations, maintenance and employee benefits to schools, selecting the appropriate methodology for local purposes from among various allocations formulas. Additionally, personnel who handle multiple duties in a district, or who tradeoff between teaching and supervisory functions may have the time value of their salaries and benefits allocated to the appropriate functions and programs;

■ Aggregation—Summarizing all costs at their appropriate setting, program, level and school, the Model tests to see that all funds are accounted for and that costs total to the total dollars spent by a district or school, by function, grade level and program. Specifically, the methodology organizes 100 percent of the expenditure data into function, program and grade level categories at both district and individual school levels; and

■ *Reporting*—Working from a relational database, a more powerful tool than the financial

spreadsheet, analysts use both a set of 167 standard reporting exhibits (tables and charts) and a query model that helps to generate ad hoc reporting information. These six steps in the software program (specification, inputting, mapping, allocations, aggregation and reporting) equip school business administrators with a consistent, replicable methodology and reporting tool. Thus, the Model arms school business officials with the information to meet the rising demands for better financial information for improved managerial decision-making and better communication of this same information to the general public.

Multi-Dimensional Reporting

FAM works on four levels at once: function, organizational location, program and school—thus permitting a high level of

analytical power, sophistication and flexibility. The line items in the general ledger—identified using the coding system of the district, including the item code, source code, budget code, location code, function code, and so forth-serve as the raw data for the Model. The school business officials need to map and allocate only once, putting the blueprint of the district's financial system into FAM. Then in future years, the relational database will accept updated information automatically, mapping, allocating and reporting it yearly, quarterly or more often as needed.

In presenting each of its four sides, we see the increased analytical and reporting power of the Model. As shown in Figure 1, mission-directed information emerges from the four dimensions and the interaction among these dimensions.

By Function

The five functions in the Model include instruction, instructional support, operations, other commitments and leadership. To implement the Model, school business officials cross-walk the items in the general ledger into the appropriate functional category. Once this mapping system is inputted into the system, all subsequent reporting will be automatic, making analysis and reporting easier. Table 1 shows the Model in action: the functional breakdown of the \$245.4 million dollars expended in a typical large urban school district for the 1993-1994 school year. Instruction, for example, came to \$3,053 per pupil which is 51.30 percent of the total district per pupil average of \$5,951. Instructional support ran 11.70 percent, operations was 23.81 percent, other commitments were 7.10 percent, and leader-

School Site Total	\$204,533,877	\$4,961	100.00%	83.36%

ship was 6.16 percent.

The Model also allows ever greater detail for functional spending, a kind of "drilling down" from the five functions. to the 14 sub-functions and 33 detail-functions. Table 2 shows the costs for the sub-functions and includes instructional teachers (salaries and benefits), substitute teachers and paraprofessionals, allowing business managers to see the expenditures on an aggregate, per pupil and percentage of school site and total district per-pupil costs detailfunctions of the large urban school district. The instructional "function" as an example, is broken down into two sub-functions, face-to-face teaching (the personnel side) and classroom materials (the non-personnel costs). Then, the detail-functions under face-to-face teaching include instructional teachers (salaries and benefits), substitute teachers, and paraprofessionals, allowing business managers to see the expenditures on an aggregate, per pupil, and percentage of school site and total district per pupil costs.

Overall, as seen in the illustration, instruction as a single function ran \$125.9 million in this school district, which is \$3,053 per pupil, or 61.54 per-

cent of all school-site costs, and 51.30 percent of the district's total per pupil expenditures. Sub-function analysis is based on face-to-face teaching at 48.90 percent-with instructional teacher costs running 45.54 percent, substitute teachers 0.60 percent and paraprofessionals at 2.77 percent. One interesting finding is the comparison of printed versus electronic materials, 0.21 percent or \$12 per student for pupil-use technology versus 2.18 percent for printed material or \$130 per student. Thus, FAM permits a greater level of specificity in each function, going from the five basic functions to 33 detail-functions, as the instruction information in Table 2 indicates.

By Organizational Structure

The second side of the relational database is the ability of the software's methodology to separate costs by location by organizational structure, whether at the school-site, central office or non-allocated (pass-through costs, payments to other agencies, etc.). Table 3 shows three columns—school-site, central and non-allocate—for each of the 33 detail-functions. Interestingly, expenditures for the instruction function are seen only

at school-site (45.50 percent) with non-allocated costs mainly attributed to other commitments. The remaining two functions are divided between school and central locations. Leadership, for example, in a large urban school district ran 4.50 percent at the school site (principals, assistants and office of the principal) and 1.60 percent of central office. (Superintendent, deputies, researchers, directors and legal department). Thus FAM can separate costs by both their location (columns) and their many functions (rows), as shown. The power of the analysis, using the relational database, is to determine exact expenditures at each school for all, regular and special students, by function.

Individual Schools by Type/Level

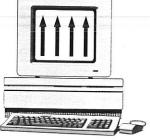

Table 4 treats the school by level or type (elementary, middle or junior high, senior high and other types including alternative, vocational and special school), permitting policy-makers to see the different costs affecting students of differing ages and levels. Among these types in the large urban school district, elementary schools as a group spent the least on instruction (\$2,898 per student or 48.70

ercent), junior high schools were next at 50.66 percent (\$3,015 per student) and high schools were the most among regular schools at 54.76 percent or \$3,259 per student. However, alternative schools—with their small size and special programs spent 71.10 percent on instruction, the highest by type. While operations overall ran 18.48 percent on average, junior high schools as a group were highest at 22.89 percent, high schools next at 18.23 percent, and elementary schools the lowest at 14.25 percent. Again, the alternative schools were most costly at 16.97 percent to run. Thus, despite two decades of advice to invest more heavily in younger children in the earlier grades, FAM shows that elementary schools received the lowest percent total at 79.12 percent, with the least spent on instruction,

48.70 percent, when compared to the average at 51.30 percent and high schools at nearly 55 percent.

Table 5 shows the result of individual school analysis, whereby the Model selects the high and low outliers for each of the five major functions compared against overall total school costs for the 81 public schools in the large urban school district. For the instruction function, Robbins Elementary School was the high at \$3,923 per pupil, while Peters Elementary School was the low at \$2,345 per student, with a difference of \$1,578 per pupil between them. Similar comparisons can be made for junior and senior schools, with Warren Science Junior High and Nordman High School being the highs and Miller Jr. High School and Norfolk Sr. High School, the lows by type and instruction.

The other functions show

interesting differences, with operation expenditures totaling 49.39 percent at Warren Science Junior High and Milton Elementary at 4.41 percent. The total cost differences went from 108.18 percent or \$6,438 per pupil at Kelly Elementary School to a low of 59.57 percent or \$3,545 per pupil at Peters Elementary. Again, FAM has the capacity to drive costs to individual schools by function, showing the way resources are used in each school and for each function.

By Program

The fourth dimension of FAM is program, including special education, general education, bilingual and others which include Chapter I/Title I, Summer and Saturday programs, and other categories. Data can be aggregated by program for the

whole system—by function and also can be driven down to each school.

Table 6 shows the additional cost per student attributed to the special education, general education and bilingual. Likewise, such program data can also be used in each school to test the effects on these school's rankings, perhaps affecting their outlier status. For example, a school may be a high outlier when all costs are included. When special education is separated from general education (regular education) costs, however, the outlier status may disappear, since the higher costs of special education drove up the overall cost of the average expenditures for each function. A dependence on average costs can thus obscure the variation within and between schools by program.

Table 7 shows an example of an elementary school in a large urban school district both before and after the special education costs for instruction are isolated and accounted for in the analysis. The top row shows the pupil populations for all students (343), for special education full-time, self-contained students (110) and the remaining regular education students (233). The second row isolates the aggregate costs at \$1.238 million for total students, \$0.496 million for special education, and \$0.740 million for the regular students. Rows three and four show the per pupil and percent of total district costs based on the average of \$5,951 per student.

As shown in Table 7, when all costs are included for instruction at this school, the total is 60.58 percent of district per pupil spending or \$3,606 per pupil. However, when the special education costs are accounted for at 75.84 percent (\$4,513 per student) and then removed from the analysis, the regular education funds for instruction dip to 53.39 percent or \$3,177 per pu-

... This shows the distortion on instructional expenditures when special education or other special program costs are included. The power of the analysis, using the relational database, is to determine exact expenditures at each school for all, regular and special students by function.

Separating Costs

The Finance Analysis Model builds a computerized reporting system—working off a relational database—that can separate costs by *organizational setting* (central office, school site, other), by *function* (instruction,

instructional support, operations, other commitments, and leadership), by type or level of school (elementary, middle, high), by individual schools and by program (special education, regular education, bilingual, Chapters 1 & 2). When these costs are cross-tabulated at each school, by function, type, program and location, the capacity exists to raise questions and answer them quickly off the database. This query function permits decision makers to find and share costs with parents, teachers, administrators and communities about how resources are being allocated and used,

where and for what purposes.

Actionable information should be accurate, specific, available and flexible. It can provide school business managers with the tools they need to meet the rising demands in American education. FAM provides many of these qualities as the analysis here shows. In efforts toward greater school-site accountability and productivity, information is key. As accounting expert Riashi-Belkaoui (1992) explains,

The interaction of the management accounting system with all other systems within the organization,

and especially the integration of these systems, is essential for an efficient functioning of the organization. A management accounting system may be defined as the set of human and capital resources within an organization that is responsible for the production and dissemination of information deemed relevant for internal decisionmaking. (1992, p. 13)

With high quality information, related to the structure, costs and uses of funds in the school system and individual schools, it is possible to make school-site management and shared decision making effective. The Finance Analysis Model provides a dynamic relational database for school business officials. While FAM does not provide the complete answer to complex policy issues in education, it does generate the information necessary (when used in combination with test scores, attendance data, teacher qualities and the like) to improve the productivity and efficiency of America's schools.

OMAHA, NEBRASKA VOL. 132, NO. 79

School Spending Up; Focus on Classroom

Schuerman Labels Trend Good News'

BY PAUL GOODSELL and JUDITH NYGREN W.ORLD-HERALD STAFF WRITERS

The Omaha School District spent \$6,460 per student last year, an 8.6 percent increase compared with two years ago - with most of the extra money going to classroom instruction.

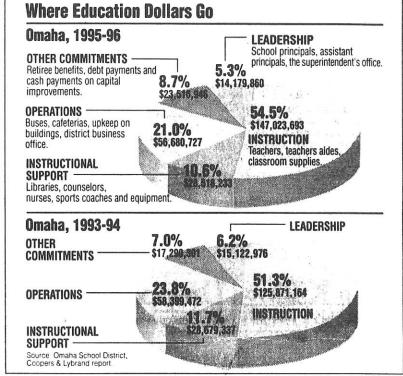

Overall, a new district analysis indicates that Omaha school officials have shifted the way they spend taxpayer money: more for instruction and capital expenditures and less for transportation, school building operations and administration.

"I think it's a 'good news' story, especially for those who think the district spends too much on leadership," said Omaha Superintendent Norbert Schuerman. "Whenever a district can demonstrate that it places the majority (of its resources) on instruction, it would appear its focus is in the right direction.'

The new report, which was presented to the school board Monday, marks the second time that Omaha school finances have been analyzed under an approach developed by the Coopers & Lybrand

accounting firm.

The analysis is intended to give poli-cy-makers new information about school spending by tracking money in different ways. District officials said they intend to use the report to help set priorities in response to spending and

tax limits passed by the Nebraska Legislature last year.

Because the Coopers & Lybrand approach differs from the way Nebraska school districts normally report financial information, the new report can be compared only to the accounting firm's analysis of Omaha School District spending in the 1993-94 school year. Other Omaha-area school districts have not adopted a similar approach.

Two years ago, the district paid Coo-

pers & Lybrand to produce a thick three-volume report. This time, the district did its own analysis using the company's methodology and computer software.

The new report shows that the district spent \$269.9 million on its 41,785 students during the 1995-96 school year.

In 1993-94, the district spent \$245.4 million on 41,231 students. That was Please turn to Page 2, Col. 1

Most of Added School Spending Went to Classroom

Continued from Page 1

equal to \$5,951 per student.

The biggest change in the past two years was the amount spent on a category that includes teachers, teacher aides and classroom supplies. In the earlier Coopers analysis, 51.3 percent of the district's money went to those areas. I ast year, the category accounted for 54.5 percent of all spending.

About 86 percent of the district's total \$24.5 million in increased spending was in face-to-face teaching and classroom materials.

In comparison, the district spent about \$1 million less on principals, assistant principals, the superintendent's office and other administrative spending. Spending on operations — buses, cafeteria, building upkeep and other business functions — declined by \$1.7

million.

Instructional support, which includes libraries, guidance counseling and centralized curriculum development, dropped slightly.

Spending on capital improvements, debt service and other commitments went up \$6.2 million in two years.

Much of the increase in classroom instruction spending probably is attributable to teacher salary increases during the past two years, said John Mackiel, school board secretary and chief financial officer.

Mackiel said there have been no specific policy changes to boost classroom spending, such as a move toward smaller class sizes. But it does reflect sentiments voiced by board members after the first report in favor of increasing the share of spending on instruction.

But the district has increased its teaching staff by about twice the rate of its enrollment increase. Some 83 teaching positions were added during the period spanned by the two reports, an increase of about 2.8 percent, compared to a 1.3 percent enrollment increase.

Schuerman said the rise in classroom spending reflected district efforts to keep money "as close to students as possible." He said the district has hired paraprofessionals to help teachers whenever possible.

Mackiel said operating costs have been trimmed in several areas during the past two years, including a \$700,000 reduction in transportation spending by revising school bus routes. He said the administration's share of total spending declined, in part, because of the retirements of senior, more highly paid staff. Mackiel said school officials plan a detailed review of the numbers to determine whether district spending matches board priorities. He said those priorities include "at-risk" students, technology, middle schools and curriculum.

The analysis also will help the district deal with the need to cut spending because of the state limits on property taxes. He said it is unlikely that the district will be able to spend as much as it currently does once the limits take effect—unless money is found to replace property-tax revenue.

"The snapshot we see today is not going to be the same in 36 months," Mackiel said. "We need to ensure that quality isn't compromised when, in fact, the dollars will be decreased."

Watching our pennies

standable even if you can't balance your checkbook. The Finance Analysis Model developed by Coopers and Lybrand, a national accounting firm, shows just where education money goes. South Carolina is the only state to use such a system statewide. and next year FAM will be expanded to track dollars even at the Individual school level.

According to the report on 1994-95. South Carolina spent \$3,572,878,068 on kindergarten through 12th grade. Fifty-two percent of the funds went to instruction, almost all of that to face-to-face teaching. Another 12.55 percent went to instructional support (salaries of librarians, guidance counselors, supplies such as textbooks), almost all of that for pupils, rather than teachers or programs. Nearly 20 percent went to operations, which includes school facilities and money and shape its use to their will.

It's a rather amazing document, under- pupil services that aren't instructional. The remainder was spent on leadership (school boards, superintendents and their district office staff, principals and assistant principals) and other commitments, such as debt service or capital projects.

> FAM is intended to help school personnel, parents and other community members understand just where public money goes. With that understanding, wiser decisions can be made. Then, districts can "target dollars where they can do the most good and communicate in an understandable way where the money goes," says the current FAM report.

> We teach that knowledge is power. The financial knowledge the S.C. Department of Education is offering with FAM-will - if used — empower communities to follow the
